

Gleichungen, Ungleichungen, Bruchgleichungen

Bestimme Definitions- und Lösungsmenge!

$$\mathbb{G} = \mathbb{Q}$$

$$5(7+x) = 3(8+8x) - 141$$

$$(9+x)(15+x) = (3+x)(5+x)$$

$$5x - 4 < 51 - 6x$$

$$\frac{4x-5}{9x-5} = \frac{4(2x-4)}{18x-26}$$

$$-2(1-3x) > 80 + (-3x-8)$$

$$\frac{a-1}{a-2} = \frac{a-2}{a-1}$$

$$(2x-2)(2x+2) \geq (x-3)(x+5) + 3x^2$$

$$(x-0,1)^2 + (x+0,2)^2 = (x-0,1)(x+0,1) + (x-0,2)^2$$

Lösungen:

$$\mathbb{D} = \mathbb{Q} \setminus \{1; 2\}$$

$$\mathbb{D} = \mathbb{Q} \setminus \left\{ \frac{5}{9}; \frac{13}{9} \right\}$$

$$\mathbb{IL} = \{5\}$$

$$\mathbb{IL} = \{1,5\}$$

$$\mathbb{IL} = \{x \mid x \leq 5,5\}$$

$$\mathbb{IL} = \{x \mid x > 8\}$$

$$\mathbb{IL} = \{8\}$$

$$\mathbb{IL} = \{x \mid x < 5\}$$

$$\mathbb{IL} = \{-7,5\}$$

$$\mathbb{IL} = \left\{ -\frac{1}{30} \right\}$$
